# **Background Information**

Nucleophosmin (NPM1,B23) is a putative ribosome assembly factor with a high affinity for peptides containing nuclear localization signals (NLSs). The transport of proteins across the nuclear envelope is a selective, multistep process involving several cytoplasmic factors. Proteins must be recognized as import substrates, dock at the nuclear pore complex and translocate across the nuclear envelope in an ATP-dependent fashion. Several cytosolic and nuclear proteins that are central to this process have been identified. The 38 kDa nuclear protein nucleophosmin is  $involved\ in\ ribosomal\ assembly\ and\ rRNA\ transport.\ It\ is\ an\ abundant\ protein\ that\ is\ highly\ phosphory lated\ by\ Cdc2$ kinase during mitosis.
