Background Information

Platelet-activating factor acetylhydrolase 1B subunit alpha (LIS1), a critical mediator of neuronal migration in developing brain, is expressed throughout life. LIS1 forms a homodimer that interacts directly with the dynein complex and is essential for its enrichment at dynamic microtubule plus ends in mammalian cells. In addition to regulating the association of dynein with microtubule plus ends, LIS1 is required for efficient transport of many dynein-associated cargos and proper localization of Golgi complexes, endosomes, lysosomes, and mitochondria. The LIS1 protein has a calculated molecular mass of ~45 kDa. (PMID: 29150182, PMID: 29562183, PMID: 15800059)
