## Background Information

CHDH (Choline dehydrogenase, mitochondrial) is also named as CDH, CHD and belongs to the GMC oxidoreductase family. CHDH is a member of the glucose-methanol-choline family of oxidoreductases, with each member containing a consensus FAD-binding domain. Many members of this oxidoreductase family are soluble proteins but mammalian CHDH is associated with the inner mitochondrial membrane (Handbook of vitamins, Robert B, 2007). The full length protein (65 kDa) has a transit peptide of 29 amino acid and the mature CHDH is appropriately located in the inner mitochondrial membrane (PMID:12951056). 17356-1-AP can also recognize the 45 kDa isoform X3 of CHDH.
