Background Information

Achaete-scute complex homolog 2 (Drosophila), also known as ASCL2, is an imprinted human gene. This gene is involved in the determination of the neuronal precursors in the peripheral nervous system and the central nervous system, particularly important during implantation of the developing embryo, specifically in placental development and neuronal precursor determination. ASCL2 has been reported involved in tumor progression, being upregulated in colorectal tumors, and involvement in metastasis could be attributed to ASCL2-promoted cellular self-renewal as opposed to cellular differentiation (PMID: 30096149 16568095).
