Background Information

The checkpoint kinase 1 (Chk1) is a conserved kinase that imposes cell cycle delays in response to impediments to DNA replication. Chk1 kinase is downstream of the ATR kinase. ATR phosphorylates Chk1 kinase and other proteins to ensure replication is being blocked as to avoid replication fork collapse and DNA damage. Activation of Chk1 involves phosphorylation at Ser317 and Ser345 by ATM/ATR, followed by autophosphorylation of Ser296. In vitro Chk1 binds to and phosphorylate the dual-specificity protein phosphatases Cdc25A, Cdc25B, and Cdc25C, which control cell cycle transitions by dephosphorylating cyclin-dependent kinases. Selected Validation Data

Non-treated and Calyculin A treated cells were subjected to SDS PAGE followed by western blot with 28803-1-AP (Phospho-Chk1 (Ser345) antibody) at dilution of 1:1000 incubated at room temperature for 1 hours.

Immunofluorescent analysis of (4% PFA) fixed Calyculin A treated HeLa cells using Phospho-Chk1 (Ser345) antibody (28803-1-AP) at dilution of 1:400 and CoraLite® 488-Conjugated AffiniPure Goat Anti-Rabbit IgG(H+L).
