| Calculated MW: |  |
| 41 kDa |  |

Purification Method:
Antigen affinity purification
Excitation/Emission maxima
wavelengths:
493 nm / 522 nm

Rab9 GTPase is required for the transport of mannose 6-phosphate receptors from endosomes to the trans-Golgi network in living cells, and in an in vitro system that reconstitutes this process. P40 is an effector of Rab9 that interacts preferentially with the active form of Rab9. p40 does not interact with Rab7 or K-Ras; it also fails to bind Rab9 when it is bound to GDI. The protein is found in cytosol, yet a significant fraction ( $\sim 30 \%$ ) is associated with cellular membranes. P 40 is a very potent transport factor in that the pure, recombinant protein can stimulate, significantly, an in vitro transport assay that measures transport of mannose 6-phosphate receptors from endosomes to the trans-Golgi network.

Storage
Storage:
Store at $-20^{\circ} \mathrm{C}$. Avoid exposure to light.
Storage Buffer:
PBS with 50\% Glycerol, 0.05\% Proclin300, 0.5\% BSA, pH 7.3.
Aliquoting is unnecessary for $-20^{\circ} \mathrm{C}$ storage

Selected Validation Data

$1 \times 10^{\wedge} 6$ HeLa cells were intracellularly stained with 0.4 ug CoraLite® Plus 488 Anti-Human RABEPK/p40 (CL488-15105) (red), or 0.4 ug Control Antibody. Cells were fixed with 4\% PFA and permeabilized with Flow Cytometry Perm Buffer (PF00011-C).
