Background Information

TSPAN13 (also known as NET6 or TM4SF13) is a membrane protein of the tetraspanin superfamily, which are characterized by the presence of four conserved transmembrane regions. Many of these members have been implicated in signal transduction, cell-cell interactions, and cellular activation and development. Overexpression of TSPAN13 has been reported in prostate cancer, suggesting that TSPAN13 may have an important role in the progression of prostate cancer (PMID: 19148481). TSPAN13 has a calculated molecular weight of 22 kDa. This polyclonal antibody is raised against 100-204aa of human TSPAN13. The experimentally determined molecular mass of 28-35 kDa is larger than the calculated molecular mass, which could be a result of post-translational modifications (PMID: 23648579).
