Background Information

GNPDA2 (Glucosamine-6-phosphate deaminase 2) is also named as GNP2 and belongs to the glucosamine/galactosamine-6-phosphate isomerase family. It catalyzes the reversible conversion of D-glucosamine-6-phosphate into D-fructose-6-phosphate and ammonium. Human GNPDA1 and GNPDA2 shared the same fold and were predicted to form hexameric particles (PMID:12965206). This protein has 5 isoforms produced by alternative splicing with the molecular weight of 31 kDa, 29 kDa, 23 kDa and 27 kDa.
