Background Information

Heat shock transcription factor 5 (HSF5) is a member of the HSF family, which are well-known transcriptional regulators of genes encoding heat shock proteins and other types of proteins and have functions in reproduction, the immune response, and the aging process. HSF5 is a non-canonical HSF that possesses a winged-helix-turn-helix (WHTH)-like DNA-binding domain and is specifically expressed in the testis (PMID: 38958533, PMID: 39162221).
