Background Information

PPIF, also named as CYP3, PPIase F and Rotamase F, belongs to the cyclophilin-type PPIase family. PPIases accelerate the folding of proteins. It catalyzes the cis-trans isomerization of proline imidic peptide bonds in oligopeptides. PPIF is a mitochondrial matrix protein involved in the induction of necrotic and apoptotic cell death through the activation of the mitochondrial permeability transition (mPT) pore. This antibody is immunized with full length gene PPIF and absorbed by PPIA. So this antibody is specific to PPIF
