## Background Information

GALNT10 is a member of the N-acetylgalactosyltransferase family and an enzyme that catalyzes the first step in O-glycan synthesis. O-glycosylation is closely related to cell recognition, tumor cell growth, metastasis and adhesion. GALNT10 can change the cell connection and communication environment between cells, thus achieving specific biological effects. GALNT10 is highly expressed in many tumors and the tumor migration and invasion ability can be suppressed by inhibiting the expression of GALNT10 (PMID: 33275228). GALNT10 is a prognostic biomarker of high-grade ovarian serous cancer (HGSC) patients (PMID: 31853576). GALNT10 has 4 isoforms with the molecular mass of 32, 41, 62 and 69 kDa.

## Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 20822-1-AP (GALNT10 antibody) at dilution of 1:500 incubated at room temperature for 1.5 hours.

Immunohistochemical analysis of paraffin-embedded human liver cancer tissue slide using 20822-1-AP (GALNT10 antibody) at dilution of 1:200 (under 40x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0).
