Background Information

The PR-domain containing proteins (PRDMs) have a common involvement in the modulation of gene activities. A PR-domain family member usually produces two products, called PR-plus and PR-minus, which differ by the presence or absence of the PR domain, respectively. The PR-plus product is underexpressed or disrupted in cancer cells, whereas the PR-minus product is present or overexpressed in cancer cells. This imbalance in the amount of the two products, which is a result of either genetic or epigenetic events, appears to be a determining factor of malignancy. PRDM15 (PR domain-containing protein 15), also known as PFM15 or ZNF298, is a 1507 amino acid protein belonging to the PRDM family. Localizing to the nucleus, PRDM15 contains sixteen C2H2-type zinc fingers and one SET domain. It is believed to participate in transcriptional regulation and may be involved in cell differentiation and tumorigenesis. PRDM15 exists several isoform and molecular weight of respective isoform is 169 kDa, 135kDa, 62kDa.
