Background Information

PIM2 was first identified in T and B cell lymphomas in mice and is a member of a serine/threonine kinase family of proto-oncogenes, which also includes PIM1 and PIM3 (PMID:24505470). They share high sequence homology at the amino acid level; PIM1 and PIM2 are 61% identical and PIM1 and PIM3 are 71% identical (PMID:34503111). The PIM2 protein plays an important role in promoting cell survival and preventing apoptosis. PIM2 is mainly expressed in lymphoid and brain tissues. In human cells, the PIM2 kinase has only two isoforms (34 and 41 kDa), but in mice there are three (34, 37, and 40 kDa), and the 34 kDa isoform has been the main focus of many studies because it plays a crucial role in tumor progression (PMID:33854618).
