## Background Information

Inhibin, a heterodimeric member of the TGF family, consists of an alpha ( $\alpha$ ) subunit (coded by INHA) and a beta ( $\beta$ ) subunit, which combine to produce either inhibin A ( $\alpha\beta$ A) or inhibin B ( $\alpha\beta$ B). Inhibin complexes negatively regulate follicle stimulating hormone secretion from the pituitary gland. Inhibins have also been implicated in regulating numerous cellular processes including cell proliferation, apoptosis, immune response and hormone secretion.
