Background Information

HAPLN1 (hyaluronan and proteoglycan link protein 1), also known as CRTL1. It is expected to be located in the cytoplasm and extracellular, and the protein is mainly expressed in placenta and small intestine. The calculated molecular weight of HAPLN1 is 40 kDa. HAPLN1 binds to aggrecan on the hyaluronic chain, stabilizing the aggregates and thus increasing compression resistance and shock absorption. HAPLN1 also functions as a growth factor, up regulating aggrecan and type II collagen synthesis in cartilage. It seems to be an essential part of cartilage homeostasis and may also contribute to homeostasis in the disc tissue (PMID: 23537453).
