Background Information

ATP8A2 is also known as ATP1B. ATP8A2 is a member of the P4 - ATPase subfamily of P - type ATPases that actively flips phosphatidylserine (PS) and phosphatidylethanolamine (PE) across membranes to generate and maintain transmembrane phospholipid asymmetry, a property important in such cellular processes as vesicle trafficking, apoptosis, cytokinesis, neuron survival, blood coagulation, and phagocytosis. ATP8A2 consists of an N - domain involved in binding ATP, a P - domain that undergoes phosphorylation, an A - domain that functions in the dephosphorylation of the phosphorylated intermediate, and an M - domain consisting of 10 transmembrane segments that comprise the pathway for translocation of the lipid across the membrane. ATP8A2 is highly expressed in the brain, spinal cord, testis, and retina (PMID: 33565221, PMID: 33766557, PMID: 37635783).
