Background Information

CD63, also known as LIMP, LAMP-3, gp55, and melanoma-associated antigen (ME491), is a member of the four-times transmembrane protein superfamily (TM4SF), which constitutes a major component of lysosomal membranes. CD63 is used as a marker for exocytosis, is involved in cellular protein sorting of late endosomes and multivesicular bodies, facilitates exosome formation, and plays a role in activating ITGB1 and integrin signaling. Furthermore, CD63 is involved in intercellular adhesion through interactions with other cell surface molecules.
