Background Information

EHMT1, also known as GLP (G9a-like protein), encodes a histone lysine methyltransferase that controls brown adipose cell fate, adaptive thermogenesis, and glucose homeostasis in vivo (PMID: 24196706). EHMTs, along with LSD1 (an H3K4 demethylase), are components of the REST complex, which silences neuronal pathway genes in non-neuronal cells. EHMT1 is mainly responsible for the monomethylation and dimethylation of histone H3 lysine 9 (H3K9), forming a heteromeric complex with EHMT2 (G9a) in euchromatin (PMID: 34214254, 37663929).
