Background Information

The transcription factor p45 nuclear factor-erythroid-derived 2(NFE2) is one component of the NF-E2 complex that essential for regulating erythroid and megakaryocytic maturation and differentiation. It also plays crucial roles in erythroid and megakaryocytic lineages. NFE2 recognizes the TCAT/C sequence of the AP-1-like core palindrome present in a number of erythroid and megakaryocytic gene promoters, and acts as a activator. And it may has a role in all aspects of hemoglobin production from globin and heme synthesis to procurement of iron.

Selected Validation Data

HL-60 cells were subjected to SDS PAGE followed by western blot with 66436-1-Ig (NFE2 Antibody) at dilution of 1:4000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 66436-1-PBS in a different storage buffer formulation.
