Background Information

Glycogen phosphorylase L (PYGL) is one of the gene related to hypoxia metabolism and was found to be up-regulated in head and neck squamous cell carcinomas (HNSCCs) and breast cancers. Glycogen synthases (GSs) and glycogen phosphorylases (GPs) catalyze the key steps of glycogen synthesis and breakdown, while glycogen phosphorylase has three isoforms: PYGM (muscle), PYGL (liver), and PYGB (brain) (PMID: 37063425, 9529348). High PYGL expression plays an independent role in predicting the poor prognosis of glioma patients (PMID: 34177761).
