| Background Information | in the nucleus, which is ubiquitina<br>and heart. This gene encodes a mo<br>proteins are characterized by the<br>contain conserved motifs, RNP1 and<br>binding. These proteins have been | RBMS1 (RNA binding motif single stranded interacting protein 1), also known as C2orf12. It is expected to be located<br>in the nucleus, which is ubiquitinated in placenta and endometrium. Highest amounts are found in placenta, lung<br>and heart. This gene encodes a member of a small family of proteins which bind single stranded DNA/RNA. These<br>proteins are characterized by the presence of two sets of ribonucleoprotein consensus sequence (RNP-CS) that<br>contain conserved motifs, RNP1 and RNP2, originally described in RNA binding proteins, and required for DNA<br>binding. These proteins have been implicated in such diverse functions as DNA replication, gene transcription, cell<br>cycle progression and apoptosis. The molecular weight of RBMS1 is 45 kDa. |                                               |  |

## Selected Validation Data

1x10^6 HepG2 cells were intracellularly stained with 0.25 ug RBMS1 Recombinant antibody (83623-5-RR, Clone:240677D6) and APC-Conjugated AffiniPure Goat Anti-Rabbit IgG(H+L)(red), or 0.25 ug Isotype Control (blue). Cells were fixed and permeabilized with Transcription Factor Staining Buffer Kit (PF00011).

Biolayer interferometry (BLl) kinetic assays of 83623-5-RR against Human RBMS1 were performed. The affinity constant is 0.726 nM.

Various lysates were subjected to SDS PAGE followed by western blot with 83623-5-RR (RBMS1 antibody) at dilution of 1:10000 incubated at room temperature for 1.5 hours.
