## Background Information

PHD FINGER PROTEIN 19(PHF19), a protein homologous to the Drosophila 'Polycomblike' (Pcl) protein, encoded by human gene PCL, which encodes 2 deduced proteins: a short form of 207 aa and a long form of 580 aa. The PCL family proteins contains a PCL homology domain, a Tudor domain, 2 PHD fingers and a C-terminal tail. It is highly expressed in thymus and heart, while 508aa form predominant in placenta, skeletal muscle and kidney and 207aa form in liver and peripheral blood leukocytes. Both of these forms can inhibit transcriptional activity. And the long form is correlated with cancer. Acts as a transcriptional repressor. The mRNA level of PHF19 is low in many normal tissue, it's elevated in cancer-derived cell lines.

## Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 83892-3-RR (PHF19 antibody) at dilution of 1:10000 incubated at room temperature for 1.5 hours.

1x10<sup>6</sup> A549 cells were intracellularly stained with 0.25 ug PHF19 Recombinant antibody (83892-3-RR, Clone:241047D7) and APC-Conjugated AffiniPure Goat Anti-Rabbit IgG(H+L)(red), or 0.25 ug Isotype Control (blue). Cells were fixed and permeabilized with True-Nuclear Transcription Factor Buffer Set.

Bioluminescence resonance energy transfer (BRET) kinetic assays of 83892-3-RR against Human PHF19 were performed. The affinity constant is 0.806 nM.
