Background Information	LDHA, also named as LDH-M and NY-REN-59, is an enzyme which catalyzes the inter-conversion of pyruvate and L- lactate with concomitant inter-conversion of NADH and NAD+. LDHA is found in most somatic tissues, though predominantly in muscle tissue and tumours, and belongs to the lactate dehydrogenase family. It has long been known that many human cancers have higher LDHA levels compared to normal tissues. It has also been shown that LDHA plays an important role in the development, invasion and metastasis of malignancies.

## **Selected Validation Data**

Immunofluorescent analysis of (-20°C Ethanol) fixed HepG2 cells using LDHA-Specific antibody (84198-1-RR, Clone: 240885F4) at dilution of 1:250 and CoraLite®488-Conjugated AffiniPure Goat Anti-Rabbit [gG(H+L) (SA00013-2). This data was developed using the same antibody clone with 84198-1-PBS in a different storage buffer formulation.
