Background Information

The interleukin 2 receptor, which is involved in T cell-mediated immune responses, is present in 3 forms with respect to ability to bind interleukin 2. The low affinity form is a monomer of the alpha subunit and is not involved in signal transduction. The intermediate affinity form consists of an alpha/beta subunit heterodimer, while the high affinity form consists of an alpha/beta/gamma subunit heterotrimer. The beta subunit (IL2RB, also known as CD122 and p75) is involved in receptor mediated endocytosis and transduces the mitogenic signals of nterleukin 2.

Selected Validation Data

NK-92 cells were subjected to SDS PAGE followed by western blot with 84389-2-RR (CD122/IL-2RB antibody) at dilution of 1:4000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 84389-2-PBS in a different storage buffer formulation.

Biolayer interferometry (BLI) kinetic assays of 84389-2-RR against Human CD122/IL-2RB were performed. The affinity constant is 32.2 nM.
