Background Information

Iduronate 2-sulfatase (IDS) is required for the lysosomal degradation of heparan sulfate and dermatan sulfate. Mutations causing IDS deficiency in humans result in the lysosomal storage of these glycosaminoglycans and Hunter syndrome, an X chromosome-linked disease. IDS is synthesized as two precursor forms of 76 and 90 kDa that are converted, through a 62 kDa intermediate, to mature polypeptides due to an internal proteolytic cleavage (PMID: 10838181).

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 84623-6-RR (IDS antibody) at dilution of 1:5000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 84623-6-PBS in a different storage buffer formulation.

Biacore BLI kinetic assays of 84623-6-RR against Human IDS were performed. The affinity constant is 11.8 nM.
