Background Information

TLR6, also known as CD286, belongs to the Toll-like receptor (TLR) family which is important in the innate immune response to pathogens. TLRs are highly conserved from Drosophila to humans and share structural and functional similarities. TLR6 can form a heterodimer with TLR2. TLR6 and TLR2 are both recruited to the macrophage phagosome, where they recognize peptidoglycan, a Gram-positive pathogen component (PMID: 11095740). TLR6 interacts with CD36, following CD36 stimulation by oxLDL or amyloid-beta 42, and forms a heterodimer with TLR4. The trimeric complex is internalized and triggers an inflammatory response.
