## **Product Description**

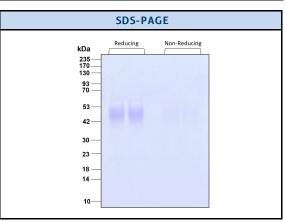

Recombinant Human LIF is a pleiotropic factor produced by numerous cell types which includes myelomonocytic lineages, T cells, fibroblasts, melanoma, liver, and heart. LIF promotes long-term maintenance of embryonic stem cells by suppressing spontaneous differentiation. Other activities include the stimulation of acute phase protein synthesis by hepatocytes, stimulation of differentiation of cholinergic nerves, and suppression of adipogenesis by inhibiting the lipoprotein lipase in adipocytes. Mature human LIF (180 aa) shares 78%, 82%, 91%, 88 and 87% aa sequence identity with mouse, rat, canine, bovine, and porcine LIF, respectively. To reduce spontaneous differentiation, LIF is typically added to stem cell culture medium.

Alternative Names	CDF, D factor, DIA, Emfilermin, HILDA, Leukemia inhibitory factor, LIF, Melanoma derived LPL inhibitor, MLPLI

Recombinant human LIF (HZ-1292) dose-dependently inhibits growth of the M1 cell line. Cell number was quantitatively assessed by PrestoBlue® Cell Viability Reagent. M1 cells were treated with increasing concentrations of recombinant LIF for 96 hours. The EC50 was determined using a 4-parameter non-linear regression model. The EC50 range is 0.045-0.25 ng/mL.
